Worker Host Groups

Host groups are a simple way to target jobs to a list of machines without specifying them explicitly every time you submit a job. These groups are unrelated to Linux groups.

To set up a host group, the Worker needs only to be configured with the list of groups it belongs to:

    worker_groups = *group* [, *group*…]

where *group* is one or more comma-delimited group names.

Example

    worker_groups = myGroup, groupB
