

How do I set my own shared directory for job types?

Set the `worker_template_path` for the Worker to point to the directory containing the Job Types. Note, that on Windows, you must use UNC and the path separator is a forward slash `/`.

- Try flipping the slashes to the other direction and see if that solves your problem

```
worker_template_path = "//qubesupervisor.as.com/jobtypes"
```

- You may not be able to use `worker_template_path` in the `qbwrk.conf`. If that is the case, you will need to modify the local `qb.conf`.
- If you ever have problems with the `qbwrk.conf`, use the command line tool:

```
qbconfigfile qbwrk.conf
```

- It will show you a fully expanded version of your `qbwrk.conf` that you can check for errors.

Every change to the `qbwrk.conf` only requires a reconfiguration:

```
qbadmin worker --reconfig
```

while a change to the `qb.conf` requires a restart of the Worker.

- You can see the current configuration of the Worker:

```
qbadmin worker --config host
```
