

Test Write Job Submission

Use this example to ensure the correct permissions are set on the network storage (this will ensure that other jobtypes will be successful in writing the output to the required locations). If the Write Job fails, see the [Troubleshooting](#) section down the page.

1. Select Submit > Tests > Qube Test (file Write) Job...

Qube 6.2.0 [Supervisor: 192.168.1.117 (50 licenses)]

- Browse to a network location that the farm has mounted and create a file called "test.txt"

Submit Qube Test (file write)

Qube Job Basics

Name: Qube Test (file write) Job

Priority: 9999

Subjob Processes: 1

Parameters

file: ***CHANGE ME TO NETWORK LOCATION*** **2**

Qube SimpleCmd and Shell Parameters

Cmd Template: echo "THIS FILE IS WRITABLE." > "%(file)s"

Shell (Linux/OSX):

Qube Worker Selection

Hosts: ***SELECT HOSTS*** **3**

Groups:

Omit Hosts:

Omit Groups:

Priority Cluster:

Host Order:

Requirements:

Reservations:

Restrictions:

4

- Select the hosts in which Qube! Worker is installed
- Click Submit
- This should create a job in the "Job Layout Pane" see section 9 for further details

Troubleshooting

Should you find that your job has failed there are a few things you can check to troubleshoot the issue.

- ☐ Check that your storage has open permissions for the "qubeproxy" account
- ☐ Check that the permissions are set to "chmod 777" for testing purposes

- ☐ Run the command (OS X & Linux) "touch \$network location\$/test.txt"
- ☐ (Windows) Browse to the network location and right click > New > Notepad Document
- ☐ Hints on failures can also be found in the "Stderr" tab.
