supervisor_heartbeat_timeout

Synopsis

`supervisor_heartbeat_timeout` = *interval*

Interval is the size, in seconds, of a sliding window of time in which a Worker must contact the Supervisor after failing to respond within the `supervisor_heartbeat_interval` window. If there is no response, the Worker will be marked as "down" and a second request sent. If that second request gets no response within this timeout limit, then any instances currently running on that Worker are migrated off. This value should be at least as large as the value for `supervisor_heartbeat_interval`.

Example

`supervisor_heartbeat_timeout = 1200`

Defaults

720
