

# Global Resources

Global resources are defined in the Supervisor using the `qb.conf` file. The configuration parameter is called `supervisor_global_resources`

This subject is covered in depth in the section [System-Wide Resource Tracking](#)

The following specifies the configuration entry:

```
supervisor_global_resources = resspec [, resspec,...]
```

where *resspec* is one or more comma-delimited resource specifications. In the case of a global resource, the resource specification is described as:

```
global.name=quantity
```

where *name* is the name of the resource, and *quantity* is the total number of named resources available.

## Example

Here is an example for a site that has two licenses for Shake:

```
supervisor_global_resources = global.shake=2
```
