

supervisor_default_user_subjob_limit

Synopsis

```
supervisor_default_user_subjob_limit = limit
```

Limit specifies the default subjob limit, the maximum number of subjobs that any user may run simultaneously, across all process groups (pgrp). A value of -1 means "no limit". This may be reduced further by the pgrp subjob limit (see [supervisor_default_pgrp_subjob_limit](#)). For example, the user limit may be 200 subjobs, while the process group limit may be 50. So a given user could have a maximum of 200 subjobs running, and no individual prgp could launch more than 50.

Example

```
supervisor_default_user_subjob_limit = 5
```

Defaults

-1
