

# Complete QubeInstaller Release Notes

## Release 4.0-2

- Various bug fixes relating to supervisor installation on Windows.
- Add button to the "finished" page to remove all Qube DB data and DB Server software.
- Add current user as Qube Admin.
- Properly update Data Relay Agent (DRA) configuration file when installing DRA.

## Release 4.0-1

- Added support for properly checking the installed version of Perl on Windows (Perl v5.14, v5.16, or v5.26).

## Release 4.0-0

This is the minimum version required for installation of Qube! 7.0-0.

 **CAREFUL** - Use the QubeInstaller rather than installing directly from packages when upgrading an existing MySQL database to Qube! 7.0-0 with Postgres.

QubeInstaller v4.0-0 is the first version of the Installer that is Postgres-aware; it manages the supervisor's Postgres installation and related tasks.

- it performs several post-installation steps when installing the supervisor on Windows.

## Release 3.0

- First ever use of file extension (.qmx) for Qube! manifests, replacing the (.qmf) file extension.
- Includes the option to install the compiled Metered Licensing Agent (MLA) which is a requirement to use Qube! Metered Licensing.
- Addition of the License Agreement Addendum to cover terms and usage of Metered Licensing.
- During installation of the MLA, the following will be created:
  - cron jobs on Linux OS's
  - launchd jobs on OS X
  - and Scheduled Tasks on Windows.

## Release 2.0

- Self-update & relaunch – the installer now knows when it's out of date.
- Http rather than ftp downloads – for those secure facilities that block all inbound/outbound ftp.
- Use a kickstart file in the GUI.
- "Download Only" option can download Qube software for any/all OS(s) from one computer.
- Worker mode selection (service mode or desktop-user mode) during install.
- Worker mode will be stored in kickstart file so all subsequent installs will start the same way w/o any additional configuration.
- Notification of and the ability to update using a newer manifest file if the copy in the PFX Internet repository is newer than the local copy.
- The user who installs the supervisor will automatically become a Qube administrator.

 **2.0 Known Incompatibilities:**  
Versions 2.0 and 2.1 will **only** work for Qube! versions earlier than 6.9-0. If you want to download and install the 6.9-0 release of Qube!, you will need to upgrade to Installer Version 3.0.
